Barbara Davidson / Los Angeles Times

**TURNING HEADS:** Officer Garrett Breegle is an attention-getter with his T3. The LAPD's Central Division is testing four of the vehicles before deciding whether to acquire a fleet of them. The Los Angeles County Sheriff's Department has 25 such vehicles.

**The department is employing such Space Age innovations as 'smart' cars and high-tech three-wheelers.**

By Bob Pool, Los Angeles Times Staff Writer  
November 10, 2007

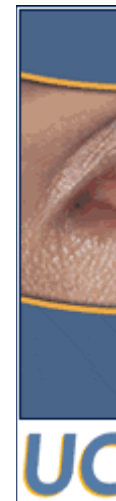

With red-and-blue lights flashing and sirens wailing, LAPD Officers Garrett Breegle and Paul Rodriguez were hurtling into law enforcement's future.

Maybe *hurtling* is not the right word. Breegle and Rodriguez were doing all of 10 mph as they patrolled the area between downtown's toy and flower districts.

They were aboard Space Age-looking scooters that have come to symbolize the high-tech turn that police work is taking in Los Angeles.

"It's Robo Cop!" someone shouted as the pair turned from

5th Street onto Los Angeles Street. A small crowd gathered when they pulled to a stop. Then the questions started flying.

"Is this a Segway?" a man asked Breegle. No, it's a T3 personal mobility vehicle, he responded. "How fast can you go?" another asked Rodriguez. About 25 mph, he answered.

With their high-intensity, light-emitting diode flashers, squad-car paint scheme and LAPD decals, these battery-driven three-wheelers are tire-squealers.

And they are not the only attention-grabbers being rolled out by police.

Reacting to communication mix-ups between protest marchers and officers during the May 1 MacArthur Park melee, police have unveiled a mobile message board that they call their Critical Incident Utility Vehicle.

Mounted atop a four-wheel-drive all-terrain vehicle, the lighted sign can be programmed from a hand-held wireless device 350 feet away to display information and instructions in various languages.

And then there's the LAPD's Smart Car. It's equipped to automatically sniff out stolen cars, recognize criminals, track fleeing suspects and conduct remote video surveillance in high-crime areas.

So far, the department has only one super squad car, but it's building another. In the meantime, bits and pieces of Smart Car technology are popping up in patrol cars throughout the city:

"Police cars over the last 15 or 20 years hadn't changed much -- they were just used to get officers from point A to point B and to store equipment," said Sgt. Dan Gomez, who runs the department's office of tactical technology. Not anymore:

\* Automatic license plate recognition cameras can identify stolen cars while officers are patrolling. The computerized cameras read license numbers on either side of and up to two car lengths ahead of the police vehicle. In a six-month test, officers using the equipment recovered 200 "parked stolens" and 40 "rolling stolens," Gomez said.

\* A dart-gun-like projectile shooter that fires a global positioning system tracking device at a fleeing car. The electronic monitor clamps onto the rear of the car, allowing officers to discontinue the chase and safely follow the suspect using satellite tracking technology. Operated by compressed air, the "StarChase" system is mounted in the patrol car's front grille. Gomez said it can fire the projectile about 20 feet.

\* Video receivers that can connect to closed-circuit TV cameras set up in high-crime areas. Officers responding to emergency calls in those areas can operate the cameras and observe the situation "in real time" before they arrive, Gomez said. So far, the cameras are set up around the Jordan Downs housing project in the Watts area, he said. Five other patrol cars in that area also have the video capability.

\* Specialized computers that allow suspects' fingerprints to be scanned and checked in the field. Wireless Bluetooth technology connects the cruiser's computer to a database that contains the fingerprints of those with outstanding arrest warrants.

\* Facial recognition equipment that can identify known suspects. The system has been used in the department's Rampart Division and has resulted in more than 50 arrests, mostly for gang injunction warrants, Gomez said.

\* In-car video cameras that record windshield views and activities in the patrol car's back seat. The system automatically uploads its images when the car returns to the police station. About 300 police cars in the department's South Bureau are being equipped with the camera gear.

Gomez said the equipment adds as much as \$100,000 to the standard \$25,000 cost of a new patrol car. Although the cost is expected to drop eventually, the timetable for citywide distribution of Smart Cars is uncertain, he said.

"It has to still be affordable," he said, adding that Chief William J. Bratton supports the Los Angeles Police Department being a test center for emerging technologies on the theory that widespread use of new equipment will drive prices down for all law enforcement agencies.
